19 Jul 2017 . Fifty years ago, if you'd asked the dinosaur experts, they would have told you that Tyrannosaurus rex was a speed freak — a giant predator that could outrun racehorses. The paleontologists would have pointed to its 3-meter hind limbs, leggy for even a big dinosaur, and described the creature as sprinting.

In everything from blockbuster movies to the imaginations of children, *Tyrannosaurus rex* is a bloodthirsty predator. It's fast and agile, able to chase down a Jeep and recover from being bowled over by King Kong. If you stand in front of a full-size *T. rex* skeleton in a museum, your own instincts might support that idea.

1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to understand the preferences and behaviors of potential customers. Once a need is identified, the next step is to develop a concept that addresses this need. This concept should be unique and offer a clear benefit to the target market. The third step is to create a prototype, which allows the team to visualize the product and test its feasibility. Finally, the product is refined based on feedback and then launched into the market. Throughout this process, it is crucial to maintain open communication with the target audience to ensure the product meets their expectations.
